Lab Manual

1 Campaign Performance Analysis

A company launched an Instagram campaign with the following data:

Particulars	Value
Total followers	15000
Reach	30,000
Impressions	45,000
Likes	1,800
Comments	300
Shares	300
Link Clicks	900
Website Visitors	800
Leads Generated	100
Sales	30
New customer Acquired	40
Single page visitors	200
Campaign Cost	₹40,000

Perform the following tasks:

a) Calculate the Engagement Rate.

Engagement Rate	(Likes + Comments + Shares) ÷ Reach × 100

Engagement Rate = 1800+300+300 ÷30,000× 100

= 2400÷30,000× 100

= 8.00%

b) Calculate the Click Through Rate (CTR).

CTR	Link Clicks ÷ Impressions × 100

CTR = 900 ÷ 45,000 × 100 = 2.00%

c) Calculate the Customer Acquisition Cost (CAC).

CAC	Campaign Cost ÷ Number of Customers Acquired

CAC = 40,000 ÷ 40

= 1000 per customer

d) Calculate the lead conversion rate

Lead Conversion Rate	Sales ÷ Leads × 100

LCR = 30 ÷ 100 × 100

= 30.00%

e) Calculate the bounce rate

Bounce Rate	Single Page Visits ÷ Total Website Visits × 100

Bounce rate = 200 ÷ 800 × 100

= 25.00%

f) Calculate the amplification rate

Amplification Rate	Shares ÷ Total Followers × 100

Amplification Rate = 300 ÷ 15,000 × 100

= 2.00%

g) Calculate the applause rate

Applause Rate	Likes ÷ Total Followers × 100

Applause rate = 1800 ÷ 15000 × 100

= 12.00%

h) Interpret the campaign performance and provide two recommendations for improvement.

Interpretation: The campaign achieved an 8.00% engagement rate and a low bounce rate of 25.00%, indicating strong audience interest and good landing page content alignment.

Recommendation 1: Optimize ad copy and call-to-action (CTA) buttons to raise the 2.00% CTR closer to industry benchmarks.

Recommendation 2: Implement automated lead-nurturing email workflows to convert more leads into sales, lowering the net CAC.

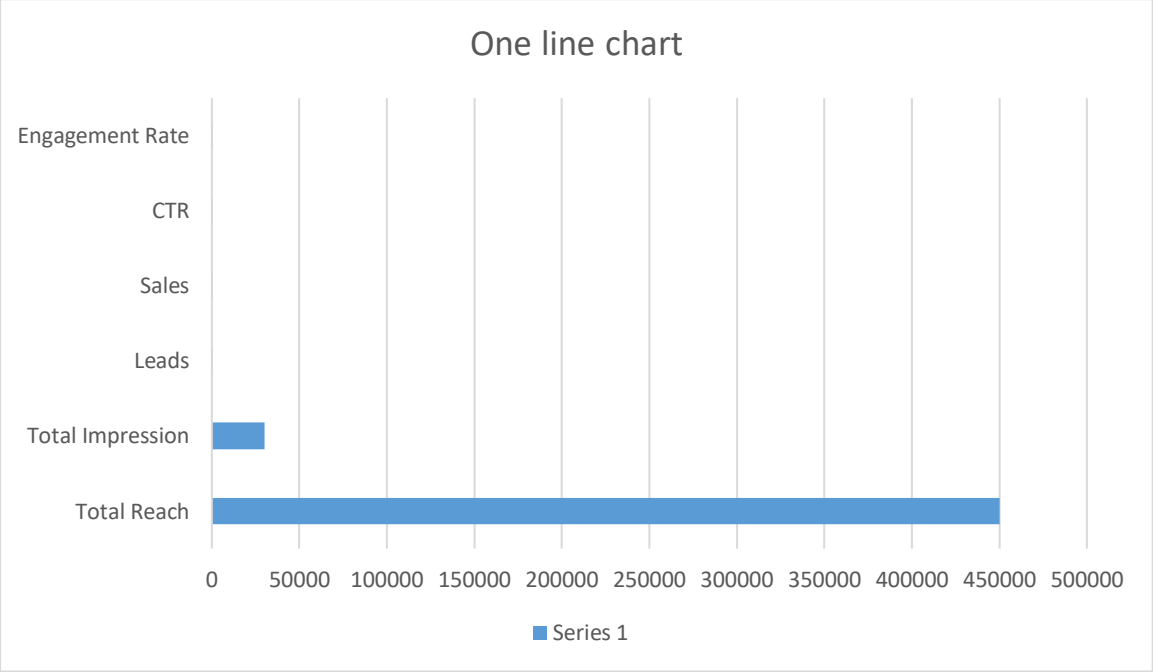

2 Dashboard Preparation

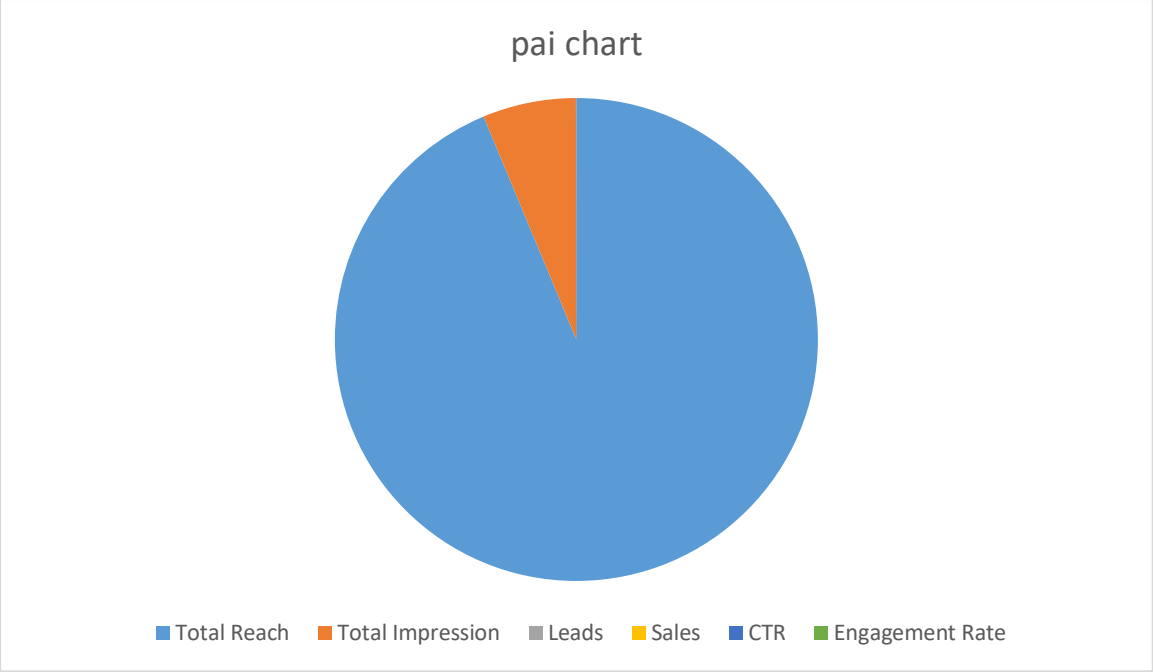

Using the above dataset,

Create a dashboard in **Microsoft Excel/Google Sheets** containing:

- Total Reach
- Total Impressions
- Engagement Rate
- CTR
- Leads
- Sales

Include **one column chart** and **one pie chart**.

3 Media Classification

Classify the following activities into Owned, Earned or Paid Media.

Activity	Classification
Website content publishing	Owned
Social media advertising	Paid
Word-of-mouth marketing	Earned
Email marketing	Owned
Influencer Marketing	Paid
Customer reviews	Earned

4 Marketing Funnel & Attribution Analysis

A campaign produced the following results.

Funnel Stage	Users
Reach	25,000
Clicks	1200
Website Visits	1050
Leads	180
Purchases	45

Perform the following:

a) Draw the Marketing Funnel.
b) Identify the stage with the highest customer drop-off.

c) Recommend the most suitable Attribution Model (First-click, Last-click or Multi-touch) and justify your choice.

Suggest one improvements to increase conversions.

(A)

Reach

25,000

|

▼

Clicks

1,200

|

▼

Website Visits

1,050

|

▼

Leads

180

|

▼

Purchases

45

(B)

Funnel Transition	Customer Drop-off
Reach → Clicks	23,800
Clicks → Website Visits	150
Website Visits → Leads	870
Leads → Purchases	135

Answer: The highest customer drop-off occurred between Reach and Clicks (23,800 users)**.** This indicates that many users saw the campaign, but only a small percentage clicked on it.

(C) Recommend the most suitable Attribution Model (First-click, Last-click, or Multi-touch) and justify your choice.

Recommended Attribution Model: Multi-touch Attribution

Justification: The campaign includes multiple customer interactions, including reach, clicks, website visits, leads, and purchases. A multi-touch attribution model assigns credit to all customer touchpoints, providing a more comprehensive understanding of the customer journey and helping marketers identify which interactions contribute most to conversions.

(D) Suggest one improvement to increase conversions.

Improvement: The company should optimize its call-to-action (CTA) and landing page content to encourage more visitors to convert into leads and ultimately complete a purchase.
